iFence – active infra-red fencing

- iFence is a wireless invisible active infrared fence with a battery life in excess of 1 year.
- iFence comprises of a transmitter and receiver unit mounted facing each other up to 60m apart at 1.2m above ground level to avoid false alarms from animals. The transmitter is linked via RF to a standard 'Armadillo' control unit to provide GSM communications back to an ARC or up to 10 mobile phones.
- Activation occurs when the dual beam is broken by an intruder passing between the two units.
- Longer detection ranges and complete site perimeters can be easily achieved by using multiple units. Additional outdoor passive detectors and voice/siren warning units can be integrated with iFence to provide complete external intruder detection.
 - Max range between sender & receiver units: 60m
 - Max range back to control unit: 300m (open space)
 - Battery life: In excess of 12 months
 - Detection method: Infrared beam interruption
 - Beam frequency selection: 4 channel
 - Interruption period: Variable between 50,100,250 & 500msec
 - Operating temperature: -20 °C - +60°C
- For best results iFence should be used in conjunction with a physical fence and combined with outdoor passive detectors and voice/siren warning units in a site-specific layout based on a detailed site survey.

With hire starting from just £40pw per detector, this is a very effective and cost effective solution to detecting intruders. Subject to a minimum 12 week hire and discounts for long duration hire.
